CHEWING GUM PRODUCT WITH DENTAL CARE BENEFITSBACKGROUND OF THE INVENTION

Dental research has developed substantial  
5 evidence that dental plaque is the predominant  
etioloical factor responsible for both periodontal  
disease and dental caries. Dental caries is the  
localized, progressive decay of the teeth. It  
results from tooth demineralization brought about by  
10 acids formed when bacteria in dental plaque ferment  
carbohydrate foods present in the mouth.

Dental plaque is a deposit which  
accumulates on the teeth and adjacent surfaces in  
the oral cavity. The plaque is a product of  
15 microbial growth, primarily derived from food  
residues in the mouth. Mucoproteins and minerals  
present from the saliva and dead cells in the mouth  
also assist in plaque formation.

Plaque is removed to some extent by  
20 effective brushing of the teeth, but the less  
accessible and more sheltered areas of the mouth  
which cannot be readily reached by a toothbrush, are  
particularly susceptible to plaque and eventual  
calculus growth. Left unhindered, the plaque

increases in size and more tenaciously adheres to the teeth. The bacterial metabolism within the plaque on the tooth surface results in the production of acids, toxins and enzymes which are deleterious to the neighboring oral tissues. There is evidence pointing to plaque as being the direct cause of dental caries, due to the generation of acids within the plaque structure.

To protect a normal tooth, a thin layer of dental enamel forms a protective coating over the tooth. This coating consists mainly of calcium, phosphate, and other ions in a hydroxyapatite-like structure. The enamel contains 2-5 percent carbonate, which makes the enamel susceptible to acid dissolution.

The interaction of three factors is believed to result in dental caries: a susceptible tooth surface; microflora; and suitable substrate for the microflora. Although several acidogenic microorganisms that are present in the mouth can initiate carious lesions, *Streptococcus mutans* is believed to be the primary pathogen.

It is known that foods containing fermentable carbohydrates can promote dental caries. Tooth decay begins when the *Streptococcus mutans*, that reside principally in the plaque that adheres

to a tooth surface, metabolize the fermentable carbohydrates consumed by the host. During the metabolism of the fermentable carbohydrates by the bacteria, lactic acid and other organic acids are  
5 secreted as a by-product. These acids reduce the pH of the surrounding plaque/tooth environment.

When the pH of the plaque/tooth environment drops below a critical level of 5.5 to 5.7, hydroxyapatite (calcium phosphate hydroxide,  $\text{Ca}_{10}(\text{PO}_4)_6(\text{OH})_2$ ), the key component of tooth enamel,  
10 begins to dissolve. Typically, the dissolution begins below the tooth's porous surface.

With repeated acid attacks, caused by the further metabolism of fermentable carbohydrates by  
15 the bacteria, subsurface lesions expand. If the lesions expand to the point that the enamel surface breaks, a cavity is formed and the process is no longer reversible.

The natural remineralization process  
20 involves, in part, the flow of saliva over the plaque. The saliva can raise the pH of the environment. Additionally, calcium and phosphate ions in the saliva precipitate out to replace the hydroxyapatite that was dissolved by the organic  
25 acids created during the metabolism of the fermentable carbohydrates.

Typically, this remineralization process only occurs at significant levels when the pH is above the critical level. If the saliva does not sufficiently raise the pH, significant  
5 remineralization will not occur. The remineralization process may be enhanced by fluoride in the oral cavity that speeds up new crystal growth and makes a fluorapatite-like material that is precipitated on the surface of the crystals inside  
10 the carie lesion.

The most important single factor contributing to periodontal disease is the accumulation of plaque and dental calculus (e.g., salivary tartar) on the teeth. These  
15 deposits result in tissue inflammation of the surrounding gingiva, and, as the condition increases in severity, the supporting bone is also affected. These reactions lead to the destruction of the supporting structures and the subsequent mass loss  
20 of teeth which are usually free of decay.

Although brushing the teeth with a toothbrush and dentifrice is a widely recognized technique for maintaining dental health, the average American brushes only about once a day for  
25 approximately one minute. Therefore, a great need

exists for finding additional methods for improving daily oral hygiene. Chewing gum has over the years been advocated as a possible excellent adjunct for cleaning the teeth, because people find chewing of gum very pleasurable and chew gum for much longer periods of time than they brush their teeth. Chewing gum is especially advantageous for use in circumstances where toothbrushing is not possible or convenient, such as after lunch, while traveling, or while working.

In general, chewing gum comprises a neutral and tasteless masticatory chewing gum base and one or more non-masticatory active ingredients mixed into the base. As used herein, an "active ingredient" is an ingredient such as a sweetener; a flavoring agent which determines flavor and taste characteristics of the gum; a body-treating ingredient such as a medicinal drug or pharmaceutical agent which is released at a gradual rate and ingested during chewing; or a breath-freshening ingredient which treats or reduces oral malodor. In addition, the chewing gum may contain water-soluble and usually sweet non-masticatory bulking agents, a coloring agent, or a plasticizing agent which is employed to improve the texture of the gum.

Certain active chewing gum ingredients benefit from or require encapsulation in order to achieve a gradual and controlled release of the ingredients during chewing or to promote their stability in chewing gum.

U.S. 5,139,794 describes a chewing gum which has a content of an encapsulated sodium chloride ingredient. The coating on the sodium chloride particles provides a prolonged flavor-enhancing effect without imparting a salty taste.

Of background interest with respect to the present invention are publications which disclose chewing gum products containing a bicarbonate salt such as sodium bicarbonate. Prior art references include United States Patent Numbers 4,148,872; 4,150,112; 4,156,715; 4,156,716; 4,157,385; 4,159,315; 4,160,054; 4,160,820; 4,170,633; 4,269,860; 4,639,368; 4,867,989; 4,952,407; 4,997,667; 5,077,051; and the like.

There is continuing interest in the development of novel chewing gum products which provide dental health benefits during normal usage.

Accordingly, it is an object of this invention to provide a chewing gum product which can serve as a convenient adjunct for improved dental health.

7

It is another object of this invention to provide a chewing gum product which has a content of encapsulated therapeutic ingredient for oral hygiene which is sustain-released over a prolonged period under oral chewing conditions.

5 It is a further object of this invention to provide a chewing gum product which counteracts bacteria-generated acids, enhances saliva flow, and exhibits plaque-inhibiting activity.

10 Other objects and advantages of the present invention shall become apparent from the accompanying description and examples.

---

DESCRIPTION OF THE INVENTION

One or more objects of the present invention are accomplished by the provision of a chewing gum product comprising between about  
5 15-80 weight percent of a gum base, and between about 1-30 weight percent of dispersed particles of an organic-encapsulated alkali metal bicarbonate ingredient.

In another embodiment this invention  
10 provides a chewing gum product comprising (1) between about 15-80 weight percent of a gum base; (2) between about 1-30 weight percent of dispersed particles of an organic-encapsulated alkali metal bicarbonate ingredient; (3) between  
15 about 0-25 weight percent of alkali metal bicarbonate powder ingredient; (4) between about 5-70 weight percent of a water-soluble bulking ingredient; (5) between about 0-5 weight percent of a flavorant ingredient; (6) between about  
20 0-0.2 weight percent of a colorant ingredient; (7) between about 0-20 weight percent of an abrasive ingredient; (8) between about 0-3 weight percent of a surfactant ingredient; (9) between about 0-3 weight percent of a fluoridating ingredient; and  
25 (10) between about 0-15 weight percent of glycerin or lecithin or a mixture thereof.

60285-1038

9

A present invention chewing gum may be any variety of different chewing gum types including low and high moisture, sugar or sugarless, wax-containing or wax-free, low calorie, and the like, and can contain other health agents.

A chewing gum product generally consists of a water-insoluble gum base, a water-soluble portion, and flavors. The water-soluble portion dissipates over a period of time, and the gum base portion is retained during mastication.

A conventional chewing gum base usually contains an elastomer, an elastomer solvent, and various other ingredients such as fillers, softeners, plasticizers and emulsifiers. Gum base raw materials are described in United States Patent Numbers 2,366,589; 3,821,417; 3,984,574; 4,041,179; 4,170,633; 4,400,372; 4,590,075; and 5,378,131. The history and development of chewing gum products is elaborated in "Chewing Gum" by A. H. Suck, (Haarmann & Reimer, Second Edition).

Chewing gum base elastomers for stick gum and dragees include chicle, jelutong, balata, crown gum, guttapercha, sorva, butadiene-styrene copolymer, polyisobutylene, isobutylene-isoprene copolymer, polyethylene, and the like, and mixtures thereof.

10

Chewing gum base elastomer solvents include pentaerythritol ester of wood rosin, glycerol ester of polymerized rosin, partially hydrogenated methyl ester of rosin, and the like.

5 Chewing gum base waxes include natural wax, polyethylene wax, paraffin wax, beeswax, carnauba wax, microcrystalline wax, and the like.

Chewing gum base compositions for stick gum and dragees are commercially available under tradenames such as Paloja T, Firm Paloja T and  
10 Nova T (L. A. Dreyfus Corp.). Bubble gum bases are available as Paloja Bubble T, Ladco Bubble T and Grande Bubble T (L. A. Dreyfus Corp).

An essential ingredient of a present  
15 invention chewing gum composition is between about 1-30 weight percent of a dispersed particle phase of an organic-encapsulated alkali metal bicarbonate ingredient.

The alkali metal bicarbonate core matrix  
20 of the encapsulated particles is sodium bicarbonate or potassium bicarbonate or a mixture thereof. Optionally, the alkali metal bicarbonate core matrix of the encapsulated particles can have a content between about 0.1-20 weight percent of alkali metal  
25 carbonate, based on the weight of alkali metal bicarbonate core matrix content. The alkali metal carbonate can be a sodium or potassium salt or a mixture thereof.

The average particle size of the encapsulated alkali metal bicarbonate ingredient can range between about 20-200 microns. The organic encapsulant of the coated particles typically  
5 comprises between about 5-60 weight percent of the encapsulated alkali metal bicarbonate particles.

The organic encapsulant of the coated particles is selected from hydrophilic and hydrophobic (water-insoluble) film-forming agents,  
10 and mixtures thereof, such as hydrocolloids and polysaccharides.

The term "hydrophilic" as employed herein refers to an encapsulant film-forming agent which has a water-solubility of at least about two grams  
15 per one hundred grams of water at 25°C.

The organic encapsulant can consist of 100% hydrophilic encapsulant, or 100% water-insoluble encapsulant, or any mixture thereof. The rate of alkali metal bicarbonate release during  
20 mastication of a chewing gum product is directly related to the hydrophilicity of the encapsulant coating on the alkali metal bicarbonate particles. A hydrophilic encapsulant coating will sustain-release the core alkali metal bicarbonate content  
25 over a period of about 20 minutes. A water-insoluble encapsulant coating will sustain-release the alkali metal bicarbonate over a period of about 35 minutes. An organic encapsulant can comprise a hydrophilic polymer having a content between about  
30 5-80 weight percent of a water-insoluble polymer.

60285-1038

12

Suitable hydrophilic encapsulants for coating the alkali metal bicarbonate particles include gum arabic, gum karaya, gum tragacanth, guar gum, locust bean gum, xanthan gum, carrageenan, alginate salt, casein, dextran, pectin, agar, sorbitol, 2-hydroxyethyl starch, 2-aminoethyl starch, maltodextrin, amyloextrin, 2-hydroxyethyl cellulose, methyl cellulose, carboxymethyl cellulose salt, cellulose sulfate salt, polyvinylpyrrolidone, polyethylene oxide, polyvinyl alcohol/acetate, and the like. Polyvinyl acetate is illustrative of a water-insoluble polymer which can be included as an additional coating component to moderate the hydrophilicity of a hydrophilic polymer coating.

Suitable water-insoluble encapsulants include polyvinyl acetate, polyacrylamide, polyvinyl chloride, polystyrene, polyethylene, polyurethane, polymethacrylate, paraffin wax, carnauba wax, beeswax, stearyl alcohol, zein, shellac, edible fat, and the like. Encapsulants utilized in chewing gum products are disclosed in U.S. 4,673,577, U.S. 5,139,794 and U.S. 4,933,190.

The encapsulant can be applied to the alkali metal bicarbonate particles by conventional coating means, such as rotating disk, fluidized bed, spray drying, freeze drying, tumbling, coacervation, and the like.

In another embodiment a present invention chewing gum product has a content between about 0.5-25 weight percent of particulate alkali metal bicarbonate ingredient which is not encapsulated.

- 5 The unencapsulated alkali metal bicarbonate can contain between about 0.1-20 weight percent of alkali metal carbonate, based on the weight of unencapsulated alkali metal bicarbonate.

- The unencapsulated alkali metal  
10 bicarbonate ingredient typically can have an average particle size between about 10-250 microns. In a preferred embodiment, the alkali metal bicarbonate is in micronized form, and has an average particle size between about 0.5-20 microns.

- 15 During mastication of a chewing gum product containing both encapsulated and unencapsulated alkali metal bicarbonate ingredients, the product provides both immediate and long lasting oral hygiene benefits. There is a clean taste and  
20 breath refreshment, and a prolonged deodorizing effect on mouth odor.

- In another embodiment a present invention chewing gum product has a content between about 5-70 weight percent of a water-soluble bulking  
25 ingredient.

The term "water-soluble" as employed herein refers to a chewing gum ingredient which has a solubility of at least about five grams per one hundred grams of water at 25°C.

5           The water-soluble bulking ingredient in a chewing gum product typically includes bulk sweeteners, high-potency sweeteners, flavorants, softeners, emulsifiers, colorants, fillers, antioxidants, and other constituents which  
10       contribute desirable attributes.

          Between about 0.1-15 weight percent of a softener ingredient can be added to enhance the chewability and mouth feel of the chewing gum. The softener ingredient can comprise glycerin or  
15       lecithin or a mixture thereof, which additionally functions as a humectant.

          The bulking ingredient can comprise between about 5-70 weight percent of a bulking sweetener. Bulking sweeteners can consist of sugar  
20       and/or sugarless constituents. Sugar sweeteners are illustrated by saccharides such as sucrose, glucose, maltose, dextrin, dried invert sugar, fructose, levulose, galactose, corn syrup solids, and the like.

25       Sugarless sweeteners are illustrated by polyhydric alcohols such as sorbitol, mannitol, xylitol, hydrogenated starch hydrolysates, maltitol, and the like.

60285-1038

15

Between about 0.025-2 weight percent of a high intensity sweetener ingredient can be utilized alone or in combination with a bulk sweetener. High intensity sweeteners are illustrated by aspartame, 5 saccharin, cyclamate, thaumatin, dihydrochalcones, acesulfame K compounds, and the like. Long lasting sweeteners can be achieved by encapsulating a portion or all of a high intensity sweetener ingredient. A higher content of high intensity 10 sweetener can be employed when it is encapsulated. Encapsulants and coating techniques can be used which are similar to those described herein for an encapsulated alkali metal bicarbonate ingredient.

Between about 0.02-5 weight percent of a 15 flavorant ingredient is usually incorporated in a present invention chewing gum product. Suitable flavorants include menthol, peppermint oil, spearmint oil, wintergreen oil, cinnamon oil, anise, and the like. The flavorant can be encapsulated, as 20 described in United States Patent Numbers 3,826,847; 5,128,155; and 5,266,335.

A present invention chewing gum product optionally can contain between about 0.001-0.2 weight percent of a colorant ingredient, 25 such as FD&C-type dyes and lakes. The colorant can be in the form of particles which give the gum matrix a speckled appearance. The speckled effect also can be incorporated in a surface coating, such as the coating on dragee gum products. Speckled gum 30 products are described in U.S. 4,744,991.

60285-1038

16

A chewing gum product additionally can contain between about 0.01-3 weight percent of an antioxidant ingredient such as butylated hydroxytoluene, butylated hydroxyanisole, propyl gallate, and the like.

Between about 1-20 weight percent of an abrasive ingredient also can be included in a present invention chewing gum product to provide a dentifrice cleaning action, in addition to the abrasive activity of the alkali metal bicarbonate ingredient. Suitable abrasives include a powder form of phosphate and silica compounds such as calcium phosphate, silica xerogel, and the like. Other types of suitable abrasives are described in U.S. 4,170,633 and U.S. 4,891,211.

The compatibility of the ingredients in a chewing gum product, and the enhancement of flavor, can be accomplished by the inclusion of between about 0.001-3 weight percent of a surfactant ingredient in the chewing gum product.

Suitable anionic surfactants include alkali metal and ammonium  $C_8-C_{30}$  aliphatic-containing carboxylate, sulfonate, sulfate and phosphate salts, such as sodium dioctyl sulfosuccinate, sodium lauryl sulfate, sodium dodecylbenzenesulfonate, ammonium lignosulfonate, and the like.

60285-1038

17

Suitable nonionic surfactants include condensation products of alkylene oxide with fatty alcohols, amines and alkylphenols, such as ethoxylated sorbitan monostearate, ethoxylated glycerol monostearate, and the like.

Suitable cationic surfactants include cetyltrimethylammonium bromide, cetylpyridinium chloride, benzyldimethylstearylammonium chloride, and the like. This type of surfactant additionally imparts antibacterial activity to a chewing gum product.

Other surfactants which are suitable for inclusion in a chewing gum product are described in U.S. 3,930,026.

A present invention chewing gum product also can contain between about 0.05-3 weight percent of a fluoridating ingredient for the prevention of dental caries. Fluoridating agents are illustrated by alkali metal fluoride, ammonium fluoride, stannous fluoride, stannous chlorofluoride, potassium stannous fluoride, alkali metal monofluorophosphate, ammonium monofluorophosphate, and the like.

A present invention chewing gum product can be produced in accordance with conventional manufacturing processes, such as those described in U.S. 4,329,369, and as demonstrated in the following examples.

18

A present invention chewing gum product provides a novel combination of properties which function as a convenient adjunct to other oral hygiene vehicles such as toothpastes and  
5 mouthwashes.

In a further embodiment this invention provides a method of oral hygiene which comprises orally masticating a present invention chewing gum product in accordance with a regimen which satisfies  
10 personal need and convenience.

The encapsulated alkali metal bicarbonate ingredient of a present invention chewing gum product is sustain-released over a prolonged period under gum mastication conditions.

15 A present invention chewing gum product provides dental cleaning action, and counteracts bacteria-generated acids, enhances saliva flow, and exhibits plaque-inhibiting and tartar-control activities.

20 The alkali metal bicarbonate ingredient of a present invention chewing gum product contributes oral care benefits such as dental cleaning and whitening, and a prolonged period of mouth odor reduction. Other derived advantages are perceptions  
25 of breath refreshment and a pleasant mouthfeel during gum chewing.

---

19

The following examples are further illustrative of the present invention. The components and specific ingredients are presented as being typical, and various modifications can be  
5 derived in view of the foregoing disclosure within the scope of the invention.

EXAMPLE I

This Example illustrates the particle size distribution of sodium bicarbonate before and after air-jet milling.

5 Commercial grade sodium bicarbonate (3DF, Church & Dwight) is processed by air-jet milling (Particle Size Technology, Inc.), and the particle size distribution of milled samples is determined in comparison with unmilled samples by  
10 means of a Microtrac laser-scattering particle size analyzer.

The 3DF sodium bicarbonate has an average particle size of 31.4 microns, and the micronized 3DF sodium bicarbonate has an average particle size  
15 of 9.8 microns.

The middle 80% of particle size distribution is between 15.4 and 55.8 microns for the 3DF sodium bicarbonate, and between 4.3 and 21.5 microns for the micronized form.

EXAMPLE II

This Example illustrates a fluidized bed procedure for encapsulating a particulate bicarbonate compound with an organic coating in accordance with the present invention.

A fluidized bed vessel is utilized which is equipped with a Wurster air-suspension coater system (WARF) as described in U.S. 4,568,559 and U.S. 4,877,621.

A coating solution is prepared by dissolving polyethylene glycol (45 g, Poly-G 2000, Olin Corp.), and propylene glycol butyl ether (10 g, PPG 14, Americol) in ethanol (500 g)/water (75 g).

Sodium bicarbonate is utilized as the core matrix crystallites. The sodium bicarbonate (Particle Size Technology, Inc.) has an average particle size and particle size distribution having correspondence with an Example I type of micronized powder.

The sodium bicarbonate powder is charged into the coating chamber of the coater system.

Compressed air is introduced into the coating chamber, and the organic coating solution is sprayed on the air-suspended bicarbonate core matrix crystallites, until the coating weight is about 30% of the total dry weight of the coated particles.

60285-1038

22

The procedure is repeated, except that hydroxypropylmethylcellulose (Methocel\* 60 HG, Dow Chemical Co.) is employed as the film-forming coating medium.

- 5           The procedure is repeated, except that maltodextrin (Lodex\*10; Durkee Foods) or amylopectin is employed as the coating medium, and 0.5 g of a surfactant is included in the solution (polyoxyethylenesorbitan monolaurate; Tween\* 20; 10 ICI Americas, Inc.).

- 15           The coated particles consist of a continuous film coating on an inner core of between about 2-10 crystallites of sodium bicarbonate. The coated particles have an average particle size of about 40 microns.

The procedure is repeated except that a polyvinyl acetate (M.W. 40,000) is employed as the polymeric medium for coating the sodium bicarbonate particles.

\*Trade-mark

EXAMPLE III

This Example illustrates the preparation of a chewing gum product in accordance with the present invention.

5           An invention chewing gum product is prepared by processing the following ingredients:

	<u>Wt. %</u>
Cafosa Luxor 225-01 gum base <sup>(1)</sup>	23.92
sorbitol liquid (70% solution)	2.39
10   sorbitol powder	31.48
mannitol powder	14.35
maltitol powder	9.57
sodium bicarbonate, micronized <sup>(2)</sup>	4.78
sodium bicarbonate, encapsulated <sup>(3)</sup>	4.78
15   peppermint oil	1.44
glycerin (96%)	7.18
sodium saccharin	0.10
Blue #2 Lake	0.006

20   <sup>(1)</sup> Cafosa Co.

<sup>(2)</sup> Average particle size of 12 microns (Example I).

<sup>(3)</sup> Polyvinyl acetate coating (Example II).

24

The sorbitol, mannitol, maltitol, micronized sodium bicarbonate and encapsulated sodium bicarbonate powders are blended. About one third of the blend is added to the preheated gum  
5 base (122°F) in a mixer unit, and the medium is mixed for about 3 minutes.

The liquid sorbitol and glycerin are combined to form a solution. About one half of the solution is added slowly to the mixer contents, and  
10 the medium is mixed for about 3 minutes.

The remaining dry blend and liquid solution portions are added with continuous mixing. The sodium saccharin and colorant are added with mixing, followed by the addition of the flavorant.  
15 The ingredient mass is mixed until homogeneous. The resultant chewing gum formulation is rolled, sheeted, sized and packaged as a stick chewing gum product.

25

WHAT IS CLAIMED IS:

1. A chewing gum product comprising  
between about 15-80 weight percent of a gum base,  
and between about 1-30 weight percent of dispersed  
5 particles of an organic-encapsulated alkali metal  
bicarbonate ingredient.
2. A chewing gum product in accordance  
with claim 1 wherein the alkali metal bicarbonate  
ingredient has a content between about 0.1-20 weight  
10 percent of alkali metal carbonate, based on the  
weight of alkali metal bicarbonate.
3. A chewing gum product in accordance  
with claim 1 which additionally contains between  
about 5-70 weight percent of a water-soluble bulking  
15 ingredient.
4. A chewing gum product in accordance  
with claim 1 which additionally contains between  
about 0.02-5 weight percent of a flavorant  
ingredient which is encapsulated or unencapsulated  
20 or a mixture thereof.
5. A chewing gum product in accordance  
with claim 1 which additionally contains between  
about 0.001-0.2 weight percent of a colorant  
ingredient.

26

6. A chewing gum product in accordance with claim 1 which additionally contains between about 0.01-3 weight percent of an antioxidant ingredient.

5 7. A chewing gum product in accordance with claim 1 which additionally contains between about 0.5-25 weight percent of an alkali metal bicarbonate powder ingredient.

10 8. A chewing gum product in accordance with claim 1 which additionally contains between about 0.5-25 weight percent of an alkali metal bicarbonate powder ingredient, and between about 0.1-20 weight percent of alkali metal carbonate, based on the weight of additional alkali metal  
15 bicarbonate powder ingredient.

9. A chewing gum product in accordance with claim 1 which additionally contains between about 1-20 weight percent of an abrasive ingredient.

20 10. A chewing gum product in accordance with claim 1 which additionally contains between about 0.001-3 weight percent of a surfactant ingredient.

11. A chewing gum product in accordance with claim 1 which additionally contains between about 0.05-3 weight percent of a fluoridating ingredient.

5 12. A chewing gum product in accordance with claim 1 which additionally contains between about 0.1-15 weight percent of glycerin or lecithin or a mixture thereof.

10 13. A chewing gum product in accordance with claim 1 which additionally contains between about 5-70 weight percent of a bulking sweetener ingredient selected from the group consisting of sucrose, glucose, maltitol, xylitol, sorbitol and mannitol and mixtures thereof.

15 14. A chewing gum product in accordance with claim 1 which additionally contains between about 0.02-5 weight percent of a flavorant ingredient selected from the group consisting of encapsulated and unencapsulated menthol, peppermint  
20 oil, spearmint oil, wintergreen oil, cinnamon oil and anise and mixtures thereof.

15 15. A chewing gum product in accordance with claim 1 which additionally contains between about 0.5-25 weight percent of sodium bicarbonate or  
25 potassium bicarbonate having an average particle size between about 0.5-20 microns.

---

16. A chewing gum product in accordance with claim 1 which additionally contains between about 1-20 weight percent of an abrasive ingredient selected from the group consisting of calcium  
5 phosphate and silica compounds and mixtures thereof.

17. A chewing gum product in accordance with claim 1 which additionally contains between about 0.001-3 weight percent of a surfactant ingredient selected from the group consisting of  
10 alkali metal and ammonium C<sub>8</sub>-C<sub>30</sub> aliphatic-containing carboxylate, sulfonate, sulfate and phosphate salts and mixtures thereof.

18. A chewing gum product in accordance with claim 1 which additionally contains between  
15 about 0.05-3 weight percent of a fluoridating ingredient selected from the group consisting of alkali metal fluoride, ammonium fluoride, stannous fluoride, stannous chlorofluoride, potassium stannous fluoride, alkali metal monofluorophosphate,  
20 and ammonium monofluorophosphate and mixtures thereof.

29

19. A chewing gum product in accordance with claim 1 which additionally contains between about 0.025-2 weight percent of a high intensity sweetener selected from the group consisting of  
5 aspartame, saccharin, cyclamate, thaumatin, dihydrochalcones and acesulfame K compounds and mixtures thereof.

20. A chewing gum product in accordance with claim 1 which additionally contains between  
10 about 0.01-3 weight percent of an antioxidant ingredient selected from the group consisting of butylated hydroxytoluene, butylated hydroxyanisole and propyl gallate and mixtures thereof.

21. A chewing gum product in accordance  
15 with claim 1 wherein the organic encapsulant comprises between about 5-60 weight percent of the surface-coated bicarbonate particle dry weight.

22. A chewing gum product in accordance with claim 1 wherein the organic encapsulant on the  
20 surface-coated bicarbonate particles comprises a hydrophilic polymer or water-insoluble polymer or a mixture thereof.

30

23. A chewing gum product in accordance with claim 1 wherein the organic encapsulant on the surface-coated bicarbonate particles comprises a hydrophilic polymer having a content between about  
5 5-80 weight percent of a water-insoluble polymer, based on the coating weight.

24. A chewing gum product in accordance with claim 1 wherein the organic encapsulant on the surface-coated bicarbonate particles comprises a  
10 polysaccharide.

25. A chewing gum product in accordance with claim 1 wherein the organic encapsulant on the surface-coated bicarbonate particles comprises a hydrocolloid.

15 26. A chewing gum product in accordance with claim 1 wherein the organic encapsulant on the surface-coated bicarbonate particles comprises a starch.

20 27. A chewing gum product in accordance with claim 1 wherein the organic encapsulant on the surface-coated bicarbonate particles comprises food grade shellac.

31

28. A chewing gum product in accordance with claim 1 wherein the organic encapsulant on the surface-coated bicarbonate particles comprises polyvinyl acetate.

5           29. A chewing gum product in accordance with claim 1 wherein the organic encapsulant on the surface-coated bicarbonate particles is selected from water-insoluble fats and waxes.

          30. A chewing gum product comprising  
10   (1) between about 15-80 weight percent of a gum base; (2) between about 1-30 weight percent of dispersed particles of an organic-encapsulated alkali metal bicarbonate ingredient; (3) between  
15   about 0-25 weight percent of alkali metal bicarbonate powder ingredient; (4) between about 5-70 weight percent of a water-soluble bulking ingredient; (5) between about 0-5 weight percent of a flavorant ingredient; (6) between about  
20   0-0.2 weight percent of a colorant ingredient; (7) between about 0-20 weight percent of an abrasive ingredient; (8) between about 0-3 weight percent of a surfactant ingredient; (9) between about  
25   0-3 weight percent of a fluoridating ingredient; and (10) between about 0-15 weight percent of glycerin or lecithin or a mixture thereof.

---

32

31. A chewing gum product in accordance with claim 30 wherein the bulking ingredient is a sweetener selected from the group consisting of sucrose, glucose, maltitol, xylitol, sorbitol and mannitol and mixtures thereof.

32. A chewing gum product in accordance with claim 30 which contains between about 0.02-5 weight percent of a flavorant ingredient which is encapsulated or unencapsulated or a mixture thereof.

33. A chewing gum product in accordance with claim 30 which contains between about 0.001-0.2 weight percent of a colorant ingredient.

34. A chewing gum product in accordance with claim 30 which contains between about 1-20 weight percent of an abrasive ingredient.

35. A chewing gum product in accordance with claim 30 which contains between about 0.001-3 weight percent of a surfactant ingredient.

36. A chewing gum product in accordance with claim 30 which contains between about 0.05-3 weight percent of a fluoridating ingredient.

33

37. A chewing gum product in accordance with claim 30 which additionally contains between about 0.5-25 weight percent of an alkali metal bicarbonate powder ingredient.

5           38. A chewing gum product in accordance with claim 30 which contains between about 0.1-15 weight percent of glycerin or lecithin or a mixture thereof.

10           39. A chewing gum product in accordance with claim 30 wherein the organic encapsulant on the surface-coated bicarbonate particles comprises a mixture of starch and polyvinyl acetate.

15           40. A method of oral hygiene which comprises orally masticating a claim 30 chewing gum product in accordance with a regimen which satisfies personal need and convenience.
